要約

日本は2010年にミナミマグロ耳石を315個体から収集した。2006-2009年に漁獲されたミナミマグロ369個体の年齢を査定し、2011年にデータをCCSBT事務局へ提出した。

Summary

Japan collected otoliths from 315 SBT individuals in 2010. Ages were estimated from 369 SBT individuals which were caught between 2006 and 2009 and submitted to the CCSBT Secretariat in 2011.

1. Activities of otolith collection and age estimation

1) Otolith Collection:

In 2010, Japan collected otoliths from a total of 315 SBT individuals. 93 of them came from commercial longline vessels through the scientific observer program (CCSBT-ESC/1107/23). 222 of them came from small fish presumably age 0-2 collected in the piston-line trolling survey (CCSBT-ESC/1107/29).

2) Age estimation:

Ages of otoliths from 369 individuals were estimated following to the CCSBT manual, “A manual for age determination of southern bluefin tuna *Thunnus maccoyii*.” Each of two staff members in Marino-Research Cooperation, who did the same work for years, estimated the age once respectively and independently. Then, one of the staff members determined the estimated age with referring to previous estimation of the two staff members.

The data of age estimated with capture information were sent to the CCSBT Secretariat in 2011. The number of individuals by year caught and CCSBT area in the 2011 data is shown in Table 1. Number of individuals by year caught and at fork length class in the 2011 data is shown in Table 2. Fork length of fish ranged from 78 to 200 cm. The range of age estimated was from 2 to 28.

2. Analysis of age data

All age data which were submitted to the CCSBT by Japan from 2005 to 2011 were analyzed. The data includes 3654 individuals (Table 3). There are more than 200 individuals of age data in every year between 1998 and 2005, and 2007.

Statistical values of fork length and age estimated at 5 cm fork length class, as well as of age estimated, are shown in Table 4 and Table 5. Twenty five out of 3654 individuals (0.68%) were not able to be estimated its ages (readabilities are 0 or 1). No otolith was assigned to readability 5 (no doubt).

Relationships between fork length and age estimated are shown in Fig. 1 and Fig. 2. While there are a few outliers, majority of plots seems to be appropriate. Parameters of von Bertalanffy growth equation were estimated by the least square method as follows.

$L_{inf} = 182.4$ cm, $K = 0.168$, $t_0 = -1.506$ (year)

The length at age relationship used in CCSBT (mean length at age for 2005 catch) is corresponded well with the von Bertalanffy growth curve by the otolith data (Fig. 3).
